

Bad Things May Be Good for You: creativity and regret

Alan Dix

Lancaster University

www.hcibook.com/alan/

Southampton 9 Feb. 2009

today I am not talking about ...

- intelligent internet interfaces
fuzzy personal ontologies and
structure from folksonomies
- visualisation and sampling
- situated displays, eCampus,
small device – large display interactions
- fun and games, virtual crackers,
artistic performance, slow time
- physicality and product design

but have before

... but I will talk about

bad ideas for creativity and design

for innovation
in computing

understanding regret

using computational
modeling

linked by imagination and rationality

bad ideas for creativity and design

origins ... nearly 15 years ago, UG research methods ...

Southampton 9 Feb. 2009

design exercise (recent example)

Collaborative or Social Networking Thing* for babies and/or parents of babies ...

... but ... design a bad one / silly one

* at least some physical token or device, not purely web/digital

Southampton 9 Feb. 2009

prompts ...

THE BAD

- 1 what is bad about this idea?
- 2 why is this a bad thing?
- 3 are there any other things that share this feature but are not bad?
- 4 if so what is the difference?

THE GOOD

- 1 what is good about this idea?
- 2 why is this a good thing?
- 3 anything that shares this feature but is not good?
- 4 if so what is the difference?

try different contexts

used car salesman – how would you sell it to someone?

Southampton 9 Feb. 2009

make it a good idea

- What is good - keep it
- What is bad - change it
- Change context
- Learn from aspects

Southampton 9 Feb. 2009

why bad ideas?

training:

- low commitment => easier to critique

design:

- large jumps through the design space

Southampton 9 Feb. 2009

why bad ideas?

training:

- low commitment => easier to critique

design:

- large jumps through the design space

Southampton 9 Feb. 2009

why bad ideas?

training:

- low commitment => easier to critique

design:

- large jumps through the design space
- understanding of the design space

Southampton 9 Feb. 2009

plus ...

- other divergent techniques:
 - random metaphors, putting ideas together
- arbitrary constraints:
 - time, materials, etc.
- externalisation
- personality prostheses

Southampton 9 Feb. 2009

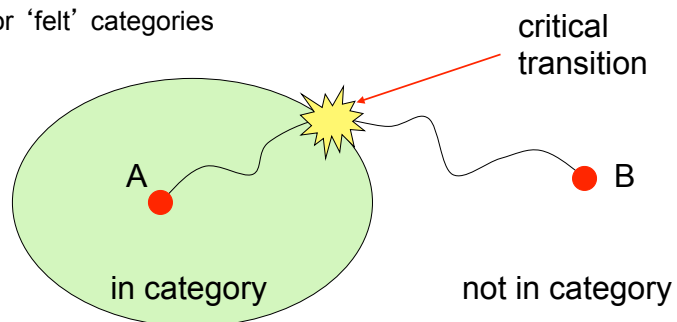

bad ideas ... related things ...

critical transitions
examples

Southampton 9 Feb. 2009

critical transitions

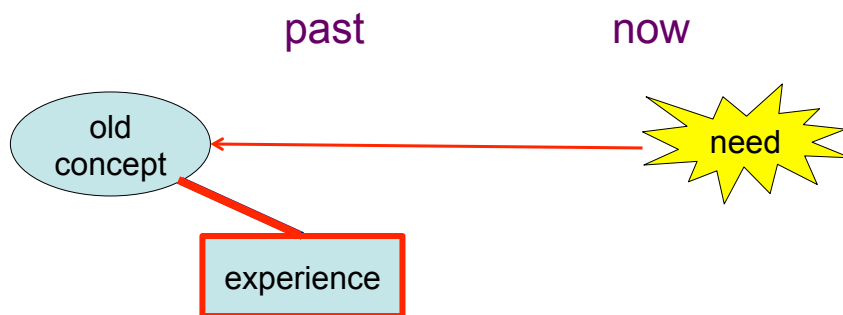

- construct a boundary case ...
 - example A in category B not in category
 - make 'path of small changes from A to B
 - where does it 'cross' the boundary
 - good for 'felt' categories

Southampton 9 Feb. 2009

but how to find examples?

- generating examples – hard
- examples from experience easy ??? or is it ???

Southampton 9 Feb. 2009

but how to find examples?

- generating examples – hard
- examples from experience easy ??? or is it ???

Southampton 9 Feb. 2009

but how to find examples?

- generating examples – hard
- examples from experience ... actually harder!

but .. generating examples ...

- take arbitrary concrete example
- morph to new concept
- constant concrete – abstract movement

Southampton 9 Feb. 2009

modelling regret

WARNING!
speculative

Southampton 9 Feb. 2009

why regret?

it seems such a negative emotion

is there some adaptive reason for it?

... or just an accident

Southampton 9 Feb. 2009

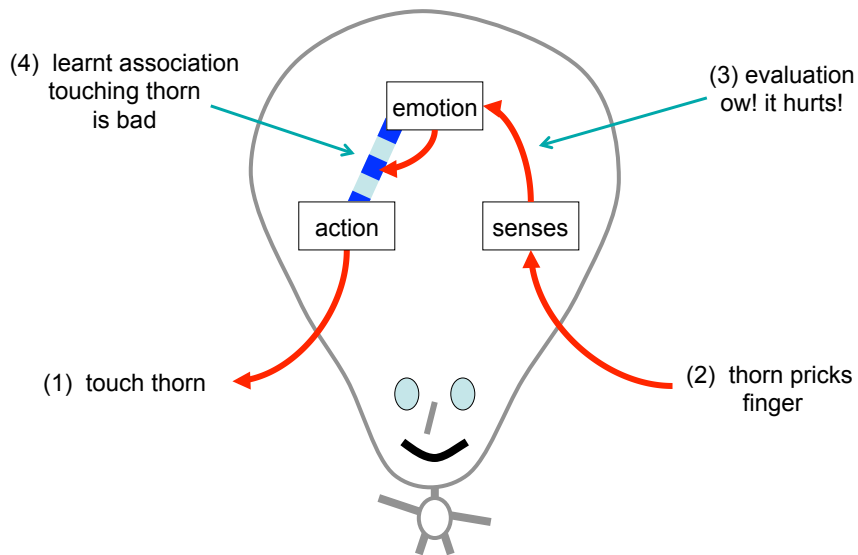

features of regret

- modal/counterfactual “what if” analysis
- worst when you ‘nearly’ averted disaster
- seems to be about learning

so how do we learn

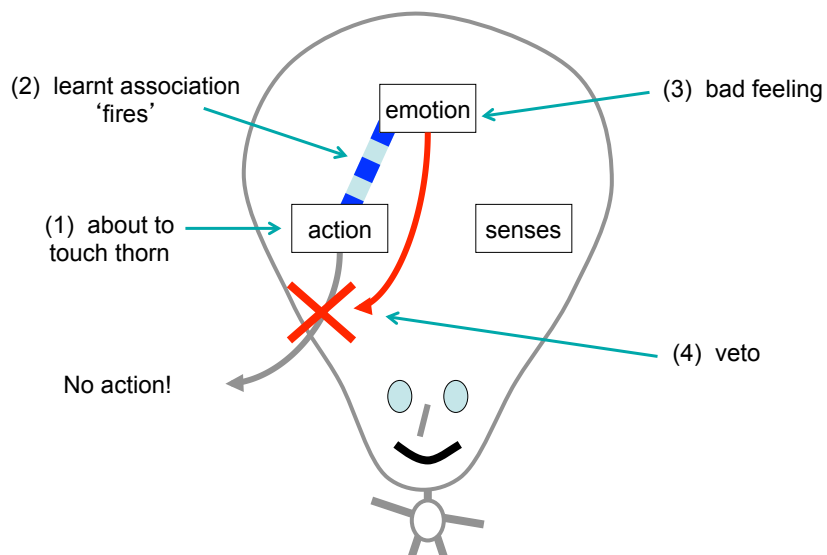

Southampton 9 Feb. 2009

basic reactions - learning

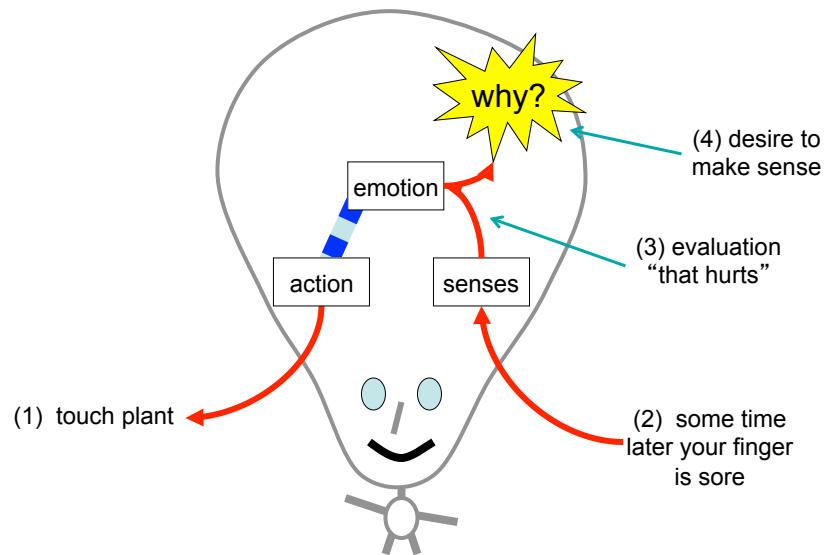

Southampton 9 Feb. 2009

basic reactions – moderating action

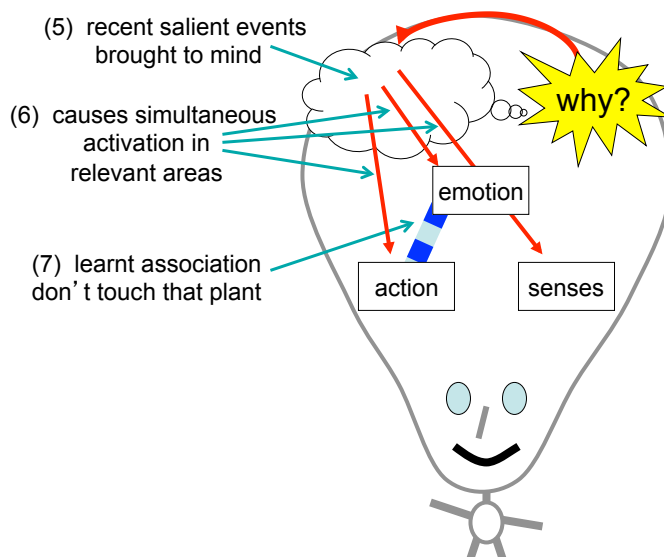

Southampton 9 Feb. 2009

delayed effect – the gap

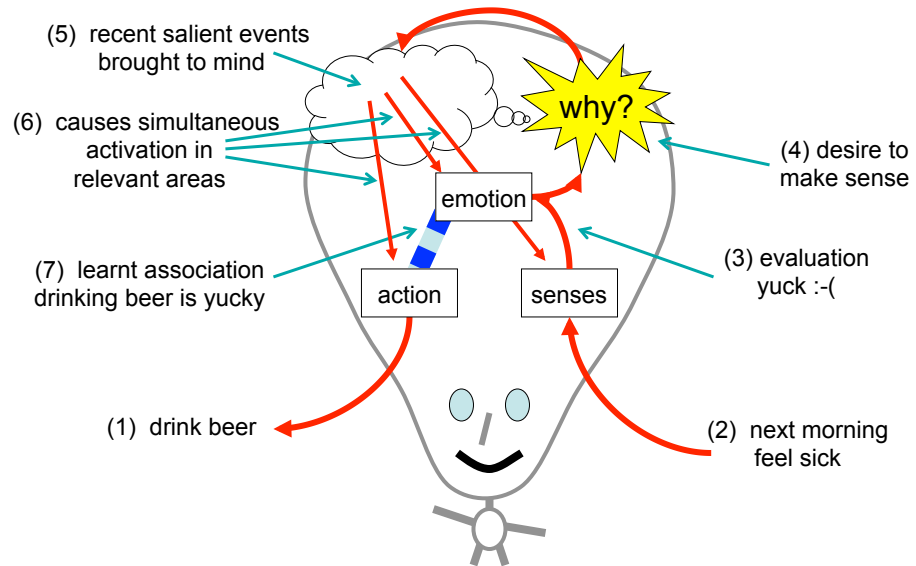

Southampton 9 Feb. 2009

delayed effect – bringing to mind

Southampton 9 Feb. 2009

delayed effect – put it together

Southampton 9 Feb. 2009

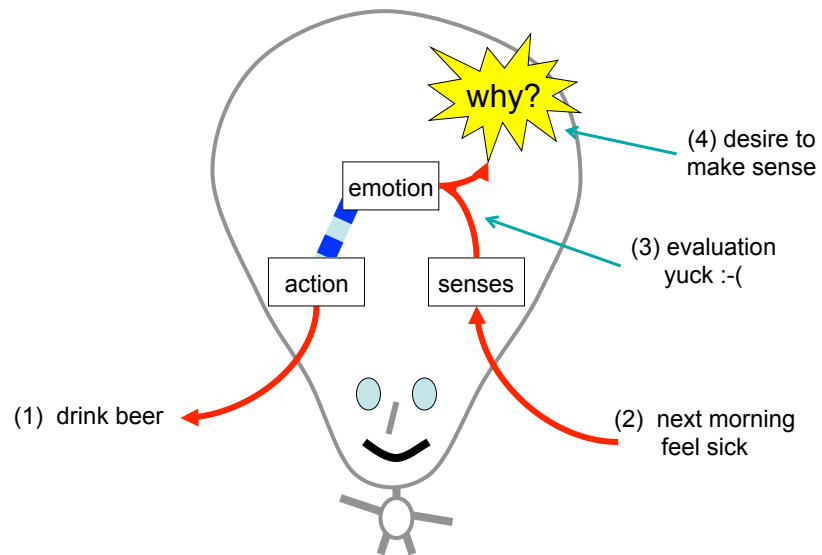

and now regret ...

similar but also:

causal connections
moderating emotions

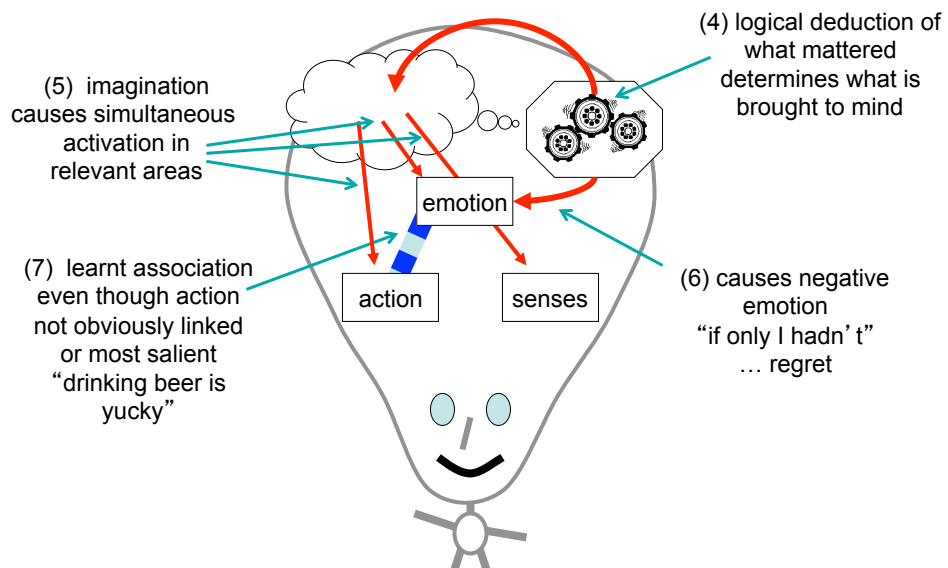

Southampton 9 Feb. 2009

regret – the gap

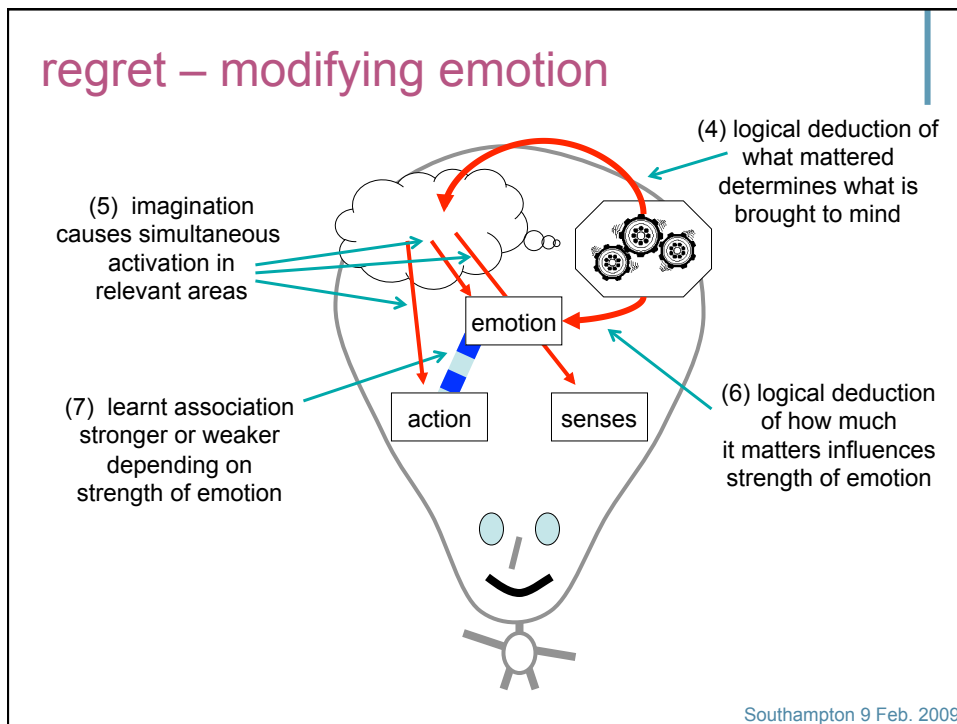

Southampton 9 Feb. 2009

regret – casual thinking

Southampton 9 Feb. 2009

but is it true?

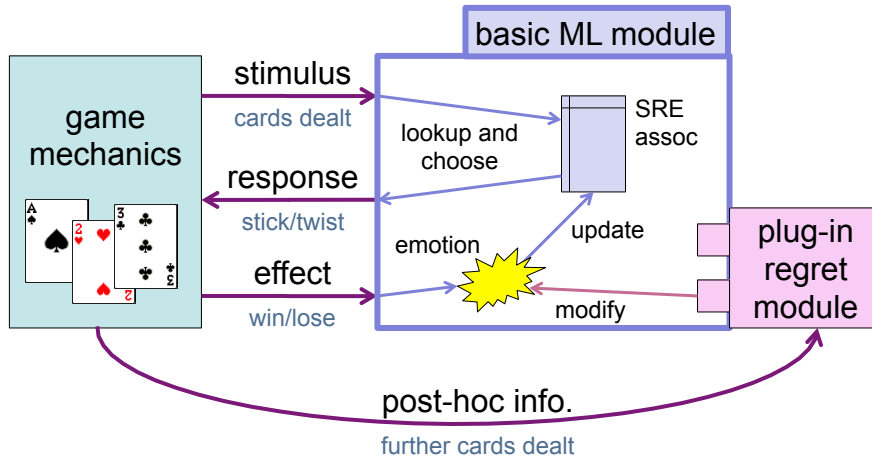

if I were a psychologist
I would run an experiment

if I were a brain scientist
I would do a scan

but as a computer scientist ...
... build a computer model

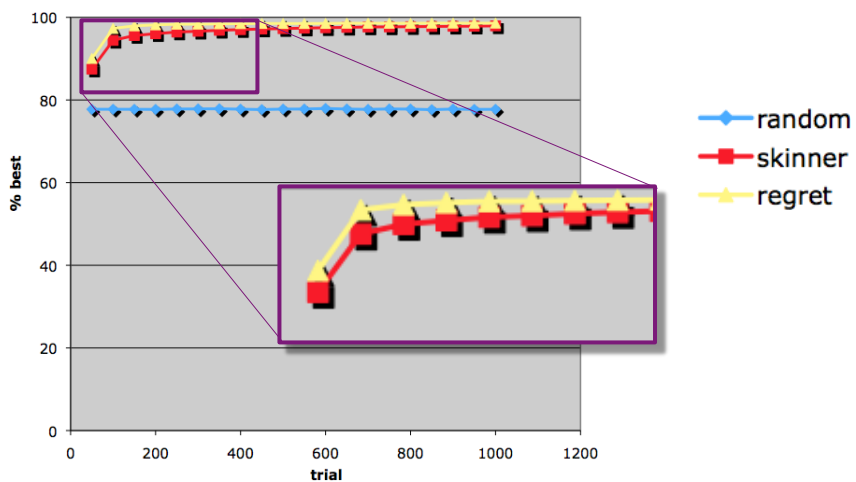

Southampton 9 Feb. 2009

model architecture

Southampton 9 Feb. 2009

it works!
faster (not better) learning 😊

Southampton 9 Feb. 2009

the data

no regret

iteration	%best
50	87.47
100	94.43
500	97.27
1000	97.94

with regret

iteration	%best
50	90.05
100	97.31
150	97.94
1000	98.60

Southampton 9 Feb. 2009

and the twist ... positive regret

the code:

```
if ( effect negative ) do Regret
```

positive regret?

the grass is greener ...

in code has greatest effect

– ameliorates winner takes all local minima

for people too?

coder thinks,
“do we need the condition?”

Southampton 9 Feb. 2009

bad things really may be good

Bad Ideas make us creative

- with the right prompts

Regret helps us learn

- maybe machines too

} both need imagination
and rationality

understanding how we think helps us:

- develop practical techniques
- maybe even tools

Southampton 9 Feb. 2009
