chapter 21
hypertext, multimedia
and the world-wide web

understanding hypertext
• what is the hyper?
• rich content: graphics, audio, video, computation and interaction

hypertext - not just linear
• non-linear structure
  - blocks of text (pages)
  - links between pages create a mesh or network
  - users follow their own path through information

hypermedia - not just text
• hypertext systems + additional media
  - illustrations, photographs, video and sound
  - links/hotspots may be in media
  - areas of pictures
  - times and locations in video
• also called multimedia
  - but term also used for simple audio/video

Text
• imposes strict linear progression on the reader
  - the author’s ideas of what is best
  - often good :-)
    ... but not always!

hypertext, multimedia
and the world-wide web
• understanding hypertext
  - text escapes linearity, words and the page
• finding things
  - navigating hyperspace
• web technology
  - how it all works
• web content
  - static: unchanging pictures and text
  - dynamic: interaction and applications on the web
animation

- adding motion to images
  - for things that change in time
    - digital faces – seconds tick past or warp into the next
    - analogue face – hands sweep around the clock face
    - live displays: e.g. current system load
  - for showing status and progress
    - flashing carat at text entry location
    - busy cursors (hour-glass, clock, spinning disc)
    - progress bars

animation (ctd)

- for education and training
  - let students see things happen ... as well as being interesting and entertaining images in their own right
- for data visualisation
  - abrupt and smooth changes in multi-dimensional data
  - visualised using animated, coloured surfaces
  - complex molecules and their interactions more easily understood when they are rotated and viewed on the screen
- for animated characters
  - wizards and help

video and audio

- now easy to author
  - tools to edit sound & video and burn CDs & DVDs
- easy to embed in web pages
  - standard formats (QuickTime, MP3)
- still big ... but getting manageable
  - memory OK ... hand held MP3 players, TiVo etc.
  - but download time needs care – tell users how big!
- very linear
  - hard to add ‘links’ often best as small clips or background

audio issues

- formats
  - raw sound samples
    - huge ... used for mixing and editing
  - MIDI
    - just which notes played and when
  - MP3
    - uses psychoacoustics - how the ear hears
- issues
  - annoying if unwanted
  - even more annoying for others!

using animation and video

- potentially powerful tools
  - note the success of television and arcade games
- but ...
  - how to harness the full possibilities of such media
  - different from ‘standard’ interfaces
  - this technology when we have much more experience.
- so ...
  - need to learn from film makers, dramatic theory, cartoonists, artists, writers

computation, intelligence and interaction

- computers??
  - don’t just show things ... do things
- examples:
  - search – the HCI book web site
  - not just exercises, table of contents ... also search
  - interaction
    - embedded applications (e.g, puzzle square)
  - adaption:
    - e-commerce sites suggest other things to buy
interacting in hypertext
Professor Alan’s puzzle square

user clicks arrows to move squares
icons to reset arrangement
not links to other puzzles

delivery technology

• on the computer
  – help systems installed on hard disk with applications
  – CD-ROM or DVD based hypermedia
• on the web
  – really ubiquitous!
    • in many countries, near universal internet access
  – not just web pages!
    • e.g. many applications have web-base documentation
  • ... and on the move ...

delivery (ctd) ... on the move

• platforms
  – mobile phones, PDAs, laptop computers
• delivery
  – CD-ROM or DVD (like desktop)
  – cached content (e.g. AvantGo)
  – WiFi access points or mobile phone networks
  – WAP – for mobile phone, tiny web-like pages
• context – who and where
  – tourist guides, directed advertising

application areas

• rapid prototyping
  – create live storyboards
  – mock-up interaction using links
• help and documentation
  – allows hierarchical contents, keyword search or browsing
  – just in time learning
    • what you want when you want it
      (e.g. technical manual for a photocopier)
        • technical words linked to their definition in a glossary
        • links between similar photocopiers

application areas (ctd)

• education
  – animation and graphics allow students to see things happen
  – sound adds atmosphere and means diagrams can be looked at while hearing explanation
  – non-linear structure allows students to explore at their own pace
  – e-learning
    • letting education out of the classroom!!!
    • e.g. eClass

eClass (formerly Classroom 2000)

an ordinary lecture?

... available later through web interface
slides, pen marks, video are ‘captured’
finding things

lost in hyperspace
structure and navigation
history and bookmarks
indices, directories and search

lost in hyperspace

• non-linear structure
  – very powerful …
  – but potentially confusing
• two aspects of lostness
  – cognition and content
  • fragmentary information – no integration … confusion
  – navigation and structure
  • hyperlinks move across structure – where am I?
• no easy solutions
  – but good design helps!

designing structure

• ideas for structure
  – task analysis to for activities and processes
  – existing paper or organisational structures
• going non-linear
  – paper and organisation single structure
  – hypertext – multiple structures
  • problems with common material, inconsistencies etc.
  • clarity of cross structure links v. important
• scent
  – do hot spots for links make it clear where they are going to??

making navigation easier

• maps
  – give an overview of the structure
  – show current location – you are here!
• recommended routes
  – guided tour or bus tour metaphor
  – linear path through non-linear structure
• levels of access
  – summary then progressive depth
  – supporting printing!
  – needs linearised content, links back to source

history, bookmarks, etc.

• revisiting
  – ‘hub and spoke’ access – click-back-click-back
  – lots of revisiting of pages
  – ‘back’ is 30% of all browser navigation
  – but multi-step back and history used less
  – bookmarks and favourites for longer term revisiting
• deep links
  – bookmarks and external links – into heart of site
  – are pages self explanatory? what site? where in it?
• e.g. breadcrumbs for context
• frames
  – difficult to bookmark, search and link to
  – but some good reasons for use (see /e3/online/frames/)

indices, directories and search

• index
  – often found in help, documentation, … even books
  – selective: not an exhaustive list of words used
• directories
  – on web index would be huge! so hand chosen sites
  – e.g. open directory project, Yahoo!
• web search engines
  – ‘crawl’ the web following links from page to page
  – build full word index (but ignore common ‘stop’ words)
  – looks up in index when you enter keywords to find pages
complex search

- too many pages for single word ...
  need to be more selective:
- Boolean search
  - combine words with logic: e.g. 'engine AND NOT car'
- link structure
  - Google uses richness of in and out links to rank pages
- recommender systems
  - use other people's choices to guide other people
- being search engine friendly
  - add 'Meta' tags, relevant title, keywords, description
  - hard to index generated pages ... the hidden web

finding research literature

- special portals and search sites:
  - e.g. citeseer <citeseer.nj.nec.com>
  - searches web for papers
  - scans the papers for bibliography
  - uses this to build up citation index

web technology and issues

- protocols and browsers
- web servers and clients
- networking

web basics ...

- the 'web' – protocols and standard
  - HTTP – to carry information over the internet
  - HTML, XML and graphics formats for content
  - browsers to view the results ... plus plug-ins
- changing use
  - initially research (CERN - high energy physics)
  - now corporate, government, commerce and entertainment, advertising, community
- challenges
  - lost in hyperspace, information overload

web servers and clients

- the web is distributed
  - different machines far across the world
  - pages stored on servers
  - browsers (the clients) ask for pages
  - sent to and fro across the internet

network issues - timing

- QoS (quality of service)
  - bandwidth
    - how much information per second
  - latency
  - how long it takes (delay)
  - jitter
    - how consistent is the delay
  - reliability
    - some messages are lost
    - need to be resent ...
    - increases jitter
  - connection set-up
    - need to 'handshake' to start
feedback - think:

- network delays too slow! so …
- feedback - think:
  - immediate local feedback - something has happened
  - slower semantic feedback - what has happened
- feedthrough between users:
  - hard - cannot avoid network

feedback and feedthrough

- think about feedback

bandwidth, latency and jitter

design implications

- bandwidth => think about download time
  - e.g. 100K image: 1 sec - broadband, 18 sec – 56K modem
  - save graphics in appropriate format and size
  - reuse the same graphics
  - in the browser cache after first load
- connection time
  - one big file may be better then several small ones
  - beware of "fit on one screen" rule - scrolling is fast!
  - think before breaking big graphic into bits
- latency => think about feedback

WAP - web on the phone

- very small screen
  - scrolling painful - small ‘pages’
  - GSM connection slow - big chunks
- WML (wireless mark-up language)
  - content delivered in ‘stacks’ of ‘cards’
  - cards are the ‘pages’ the user views
  - but navigation within the stack fast

the message and the medium

- content is king
  - the catch phrase of dot.com era … but widely ignored
- the message … content should be
  - appropriate to the audience, timely, reliable , …
  - generally worth reading !
- the medium … page and site design
  - good design = essential to attract readers
  - bad design – may mean good material never seen
  - printable!

static web content

medium and message
text, graphics, movies and sound
text

- text style
  - generic styles universal: *serif*, *sans*, *fixed*, *bold*, *italic*
  - specific fonts too, but vary between platforms
  - cascading style sheets (CSS) for fine control
  - but beware older browsers and fixed font sizes
  - colour often abused!

- positioning
  - easy left, right justified or centred
  - precise positioning with DHTML... but beware platforms...
  - screen size

- mathematics... needs special fonts, layout, ... arghhhh

graphics

- use with care...
  - N.B. file size and download time... this image = 1000 words of text
  - affected by size, number of colours, file format
  - backgrounds... often add little, hard to read text

- speeding it up
  - caching... reuse same graphics
  - progressive formats:
    - image appears in low res and gets clearer

graphics (ctd)

- formats
  - JPEG - for photos
    - higher compression but 'lossy'
    - get 'artefacts'
  - GIF for sharp edges
    - lossless compression
    - PNG supported by current web browsers

- and action
  - animated giffs for simple animations
  - image maps, for images you can click on

icons

- on the web just small images
  - for bullets, decoration
  - or to link to other pages
  - lots available!

- design... just like any interface
  - need to be understood
  - designed as collection to fit...

- under construction
  - a sign of the inherent incompleteness of the web
  - or just plain lazy?!

web colour

- how many colours?
  - PC monitors - millions - 24 bits per pixel
  - but the 'same' colour may look very different
    - N.B. usually only 72-96 dpi
  - older computers, PDAs, phones...
    - perhaps only 16 bits or 8 bits per pixel... 256 colours
    - or even greyscale

- colour palettes
  - choose useful 256 colours
  - different choices, but Netscape 'web safe' 216 are common
  - each GIF image has its own palette - use for fast download

movies and sound

- problems
  - size and download... like graphics but worse!
  - may need special plug-ins
  - audio not so bad, some compact formats (MIDI)

- streaming video
  - play while downloading
  - can be used for 'broadcast' radio or TV
dynamic web content

what happens where
technology and security
local interaction, search
remote & batch generation
dynamic content

the active web

• early days of the web
  – static pages ... mostly text
  – some gateways (ftp, gopher)
  – usability ... easy - one simple model
    (except frames break the model!)
• dynamic content
  – what is the model/metaphor ???
    • passive pages or active interface
    • each leads to different user understanding
    – no easy answers!

what happens where?

• architectural design is about what happens where
• this affects:
  – feedback
    • seeing results of one’s own actions
  – feedthrough
    • seeing effects of other people’s actions
  – also affects complexity of implementation and hence maintenance

user view

• what changes?
  – media stream, presentation, content
• by whom?
  – automatic, site author, user
  – other users - feedthrough
• how often?
  – pace of change: days, months, seconds

technology

where does it happen
client
• applets, Flash, JavaScript & DHTML
server
• CGI scripts, Java servlets, JSP, ASP, PHP, etc,
another machine
• author’s machine, database server, proxy
people
• socio-technical solutions

security

• for computation
  – code and data at same place!
• problem
  – data - needs to be secure
  – web-server - least secure machine
  – client machine even worse
    ... and networks!
local interaction (at client)

- fixed content
- use Java applets, Flash, JavaScript+DHTML
- pros: rapid feedback
- cons: only local, no feedthrough
- after interaction ... what does 'back' do ??

search

- create indices off-line
- fast lookup when needed

auto generation

- dilemma;
  - hand crafting ... leads to web stasis!!
  - so need database driven sites
- early days ad hoc, now many tools
- options:
  - client-end applet or Flash access remote DB
  - server-end CGI driven by web forms (limited UI)
- hybrid solutions
  - CGI generated pages can contain JavaScript etc.
  - JavaScript can 'write' web pages on the fly!

Java applet & JDBC

- pros: interactive DB access
- cons: bandwidth, security

CGI script accesses database

- pros: up-to-date, use existing DB
- cons: not proxy/index friendly

examples

dancing histograms are a Java applet

coin race uses JavaScript

search results returned

user's machine web server

(i) user fills field in form
(ii) user interacts locally

(iii) server returns generated pages

user's machine web server

CGI script accesses database using SQL/JDBC

user's machine web server

CGI script accesses database

(i) request to server
(ii) CGI sends database pages
(iii) CGI sends pages

user's machine web server

CGI script accesses database

(i) request to server
(ii) CGI sends database pages
(iii) CGI sends generated pages

CGI script accesses database

(i) request to server
(ii) CGI sends database pages
(iii) CGI sends generated pages
batch generation

- for slow varying data
- update local database
  - periodically generate pages and upload
- many technologies
  - C, Java, HyperCard, Visual Basic

```vbscript
Set db = openDatabase("C:\test.mdb");
sql = "select Name, Address from Personnel;"
Set query = db.OpenRecordset(sql)
Open "out.html" For Output As #1
Print #1, "<h1>Address List</h1>
query.MoveFirst
While Not query.EOF
Print #1, "<p>" & query("Name") & " " & query("Address")
query.MoveNext
Wend
Close #1
query.Close
```

batch generation of web pages

- pros: indexable, secure
- cons: slower turnaround

dynamic content

- really 'active' web pages ...
  - data updated as well as presented on the web
- presentation
  - any of the previous means: CGI, applet-JDBC
- update
  - web form/interface -> server script -> update db
  - e.g. book theatre seats
- issues
  - authentication and security
  - multiple transactions due to 'back' button
  - right pace/control – do we want human in the loop?

n-tier architecture

- one or more intermediate layers
- 'business logic' in layers
- web standard components and protocols
